

CLEANSING STICK MODEL 9084 INSTALLATION AND MAINTENANCE

Model 9084 is an immersible Cleansing Stick that gives continual protection against pathogenic bacteria, including Legionella, for emergency shower and eyewash water storage tanks. It balances the PH of the water preventing the build-up of bio-film, scale, and corrosion for up to 3 years with proper usage.

INSTALLATION:

Fully immerse the Cleansing Stick into the water needing treatment for immediate effectiveness. The unit may be placed on the bottom of the tank, or leaned against the tank corner, and the attached nylon cord used for retrieval may be secured to a position outside the tank that can be reached.

MAINTENANCE:

Inspection: The Cleansing Stick should be inspected every 6 months or at a minimum once per year during the required ANSI Z358.1 Standard annual inspection.

Cleaning: In the event of unusual sediment build-up, the Cleansing Stick should be inspected more often and thoroughly washed in clean water (under pressure where possible).

In some rare conditions, a film may coat the surface of the unit which may have a slight effect on performance. Therefore, the unit should be immersed in acetic acid (i.e. white vinegar) for a minimum of 30 minutes to remove the film. After rinsing with water, the unit can then be returned to the tank.

LIFE SPAN:

1. Product expires 3 years from the date of manufacture. The expiration date will be unaffected by intervals of removal from water.
2. The unit is designed for use, after initial immersion, on a continuous basis. However, the operational process of the unit is that the unit will prove effective even after periods where the unit has been removed from the water (i.e. cleaning or during annual inspection).
3. Freezing of the Cleaning Stick when wet can cause problems. It is recommended that when the unit is rinsed, that it be fully dry before being placed back into the tank.
4. The Cleansing Stick is inactive when out of water and the cartridges present no hazard in its use, handling, transport or storage. Disposal is completely safe at the end of its optimum life.
